Agenda

DevOps basics for Salesforce

Agentforce CI/CD pipeline : theory

Pipeline - Agentforce Classic

Pipeline - Agentforce Script

Agentforce Classic vs Script : what changed

Demo time

Watch-outs & Takeaways

DevOps basics for Salesforce

Why CI/CD?

Automate tests and deployments between environments

Stop breaking things in production

How?

Manually

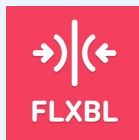

Salesforce DevOps Center

3rd party tools

Open source

Agentforce CI/CD pipeline : theory

Retrieve

👉 Manually

🏠 By a dev/admin

🏠 From dev org

Validate

🔄 Automatically

🤖 By CI on PR

🏢 On an integration org

Deploy

🔄 Automatically

🤖 By CD on merge

🏰 To prod

⚠️ Never test in prod ⚠️

Pipeline Agentforce Classic

Agentforce Classic: Retrieve

What you retrieve:

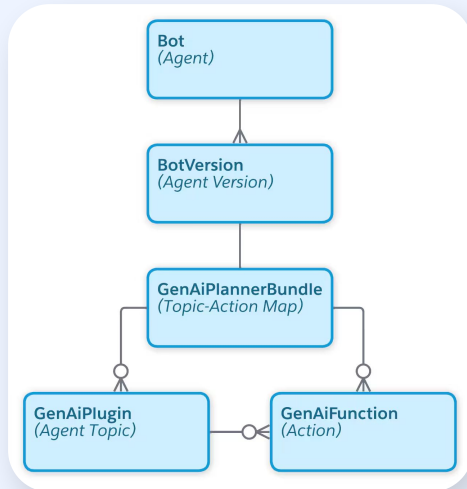

- 📦 Agent config, Topics, Actions
- 🔗 Dependencies: Prompts, Apex, Flows, etc.
- 🧪 Tests: `aiEvaluationDefinition`
- ⚠️ You retrieve EVERYTHING: no partial retrieve

How:

🔧 `sf project retrieve start`

The catch:

- 🐛 Source tracking broken in Agentforce Classic (`GenAiPlannerBundle`)
- 🔧 Workaround: `sf project retrieve start --manifest manifest.xml`
- 🔧 Fix on Salesforce side planned for Summer '26

Agentforce Classic: Validate

Deploy first:

 `sf project deploy start --manifest=manifest.xml`

 Deploy agent metadata to integration org

 Deploy test definitions separately

Then test:

 `sf agent test run --api-name=MyTest`

 Manual test management

 Manual parallelization

 Manual coverage validation

The catch:

 No auto test discovery

agentforce-validate.yml

Agentforce Classic: Deploy

Deploy everything to prod:

🔧 `sf project deploy start --manifest=manifest.xml`

📦 Same as validation: agent + dependencies

Watch out for active versions:

⚠️ If agent is active, deployment will fail

↺ Deactivate before deploying: `sf agent deactivate --api-name=MyAgent`

✓ Reactivate after: `sf agent activate --api-name=MyAgent`

That's it, no test run here:

🚀 Tests already passed in CI, just ship it

⚡ Fast deployment, no waiting

agentforce-release.yml

Pipeline Agentforce Script

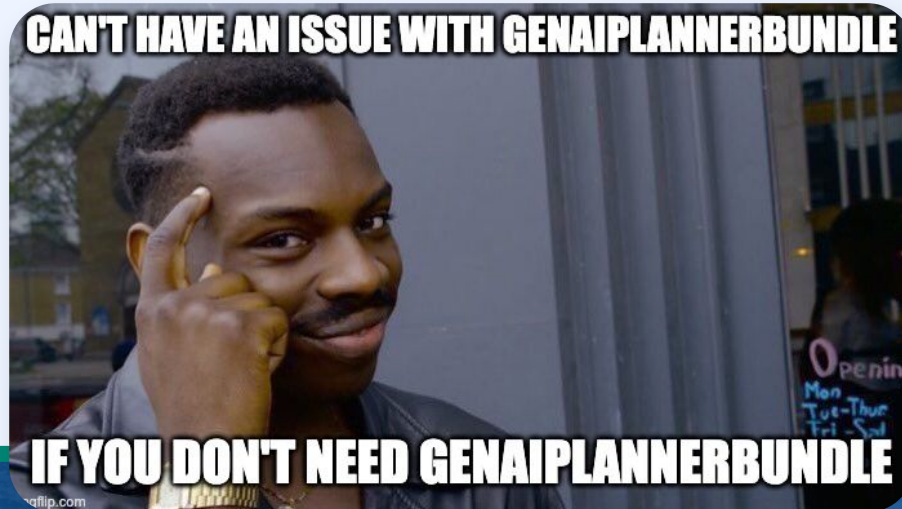

Agentforce Script: Retrieve

What you retrieve:

- 📦 Agent Script itself (`aiAuthoringBundle`)
- 🔗 Dependencies: Prompts, Apex, Flows, etc.
- 🔧 Tests: Still the old `aiEvaluationDefinition`
- ⚠️ We no longer care of all the noisy metadata (Bot, GenAi*, etc.)

How:

👉 `sf project retrieve start`

Agentforce Script: Validate

Before testing, deploy dependencies and publish agent:

- 🔗 Deploy dependencies first
- ✍️ Publish the agent: `sf agent publish authoring-bundle --api-name=MyAgent`
- 🔧 Deploy test definitions separately

Then test:

- ✍️ `sf agent test run --api-name=MyTest`
- 👉 Manual test management
- 📄 Manual parallelization
- 📊 Manual coverage validation

The catch:

- ⚠️ Make sure to have an aligned `subjectVersion` in test definition
- ⚠️ The new Agentforce Studio Testing Center is not manageable with cli yet

agentforce-script-validate.yml

Agentforce Script: Deploy

Deploy dependencies and publish agent to prod:

🔗 Deploy dependencies first

👉 Publish the agent: `sf agent publish authoring-bundle --api-name=MyAgent`

About active versions:

💧 No need to deactivate the agent

⬆ When publishing it creates a new inactive version of the agent

✅ Activate after: `sf agent activate --api-name=MyAgent`

That's it, no test run here:

🚀 Tests already passed in CI, just ship it

⚡ Fast deployment, no waiting

agentforce-script-release.yml

Agentforce Classic vs Script : what changed

Agentforce Classic

- 📦 Metadata: 6+ types
- 🐛 Source tracking: GenAiPlanner broken
- 🔧 Retrieve: --manifest workaround
- 🧪 Testing: manual management + parallelization
- ⚠️ Active versions: manual deactivation and activation

Agentforce Script

- 📦 Metadata: 1 type
- ✅ Source tracking: aiAuthoringBundle
- 🔧 Retrieve: however you prefer
- 🧪 Testing: manual management + parallelization
- ⚠️ Active versions: publish creates new version, activate after

Demo time

Watch-outs

Metadata evolved between Agentforce versions
🤔 What about future versions?

Agent versions

- ⬆ Publishing creates a new version each time
- ⚠ Need to activate with `sf agent activate`
- ⚠ Verify the `subjectVersion` in test definitions

Testing

- 👋 Still mostly manual
- 😞 Not possible to manage the new Testing Center
- ⚠ Never test in prod

Takeaways

✓ CI/CD for Agentforce is possible today with SF CLI + Agent CLI

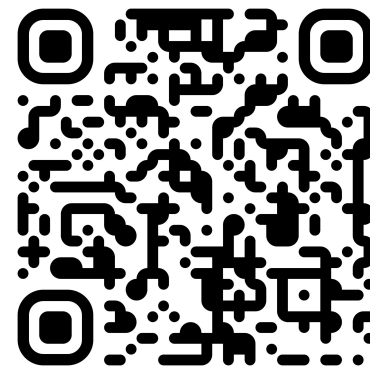

⚠ Maturity is improving but still limited: cli listing, testing center, versioning

1 2
3 4 Deploy order is critical

🚀 Automation is doable via GitHub Actions or 3rd party tools

💬 The ecosystem is evolving fast: Script is a huge improvement

NEW Agentforce Script is the way
